API SERIES NO. 280

RICE PADDY POLICY ANALYSIS FOR 2021-22 CROP

AGRICULTURE POLICY INSTITUTE MINISTRY OF NATIONAL FOOD SECURITY AND RESEARCH GOVERNMENT OF PAKISTAN ISLAMABAD October, 2021

Preface

The fundamental objective of this report is to provide information on various economic aspects of the rice crop. In this context for dynamic agricultural cost and price environment, price policy is increasingly becoming concern with anticipating future movements in agricultural production and prices and facilitating the adjustment process to those movements.

The Principal product of this institute is the economic analysis, which culminates in the recommendations to the Government with respect to minimum support price and other relevant aspects of price policy. These reports, in general, and this report, in particular, is the product of substantial background study; compilation of cost of production, widespread enquiry into markets, both at home and abroad; detailed analysis of international price data; technical studies (NPC, EPC, DRC); interviews of the farmers, including field visits; and consideration of a large number of nonprice factors.

We as API, collectively owe thanks to all the committee members and participants of the various meetings, for their valuable discussion and input, Federal and Provincial Governments for sharing of information, without all that it would have not been possible to complete.

API greatly appreciates feedback and suggestions ranging from policy makers to planners, academia, researches, student community, grower's/farmers associations, chambers of agriculture, traders etc. We are looking forward for a continued partnership in the formulation of price policy analysis and producing effective and applicable reports akin to agriculture and food security.

> (**Abdul Karim**) Director General

RICE POLICY ANALYSIS FOR 2021-22 CROP

SUMMARY OF FINDINGS AND RECOMMENDATIONS

Findings

1. Area and Production

- Rice production at the country level during the decade ending 2020-21 has grown @ 4.2% per annum owing to 2.8% expansion in area and 1.4% improvement in yield.
- At the country level production of rice from 2020-21 crop is estimated at 8.419 million tonnes which is higher by 13.6% against the 2019-20 production (7.414 million tonnes). In Punjab, production in 2020-21 increased by 27.9% which mainly happened due to 18.0% increase in area of the crop.
- In Sindh production of rice from 2020-21 crop declined by 6.2% primarily due to 8.6% decrease in area of the crop.
- Shares of the Punjab, Sindh and Khyber Pakhtunkhowa in production of 'other' varieties of rice during the period 2018-19 to 2020-21 stood at 26.7%, 67.5% and 5.8% respectively. Share of Basmati, IRRI and Others in overall rice production are 44.3, 20.2 and 35.5 per cent.

2. Domestic Prices

- Monthly average wholesale market prices of basmati paddy in Punjab during the postharvest season of 2020-21 ranged between Rs. 1844 and Rs. 2104/ 40 Kg.
- Monthly average wholesale market prices of Kainat paddy in Punjab during the postharvest season of 2020-21 ranged between Rs. 1858 and Rs. 2399/ 40 Kg.
- In Sindh, monthly average wholesale market prices of IRRI paddy in major rice producing area markets ranged between 1357 and Rs. 1633/ 40 Kg.

3. Cost of Production

- Net cost of cultivation of basmati paddy in Punjab for 2021-22 crop (inclusive land rent) is estimated at Rs. 65016 per acre. Based on this estimate cost per 40 Kg at the market level approximates to Rs. 1918.
- Net cost of cultivation of IRRI paddy in Punjab for 2021-22 crop (inclusive land rent) is estimated at Rs 63847 per acre. Based on this estimate cost per 40 kgs at the market level approximates to Rs 1337.
- The cost of cultivation of IRRI paddy in Sindh for 2021-22 crop is estimated at Rs. 57322 per acre. Adding to this Rs 60/40 Kg as marketing cost, market level cost of production of IRRI paddy in Sindh comes to Rs. 1102 per 40 kgs.

4. Economics of Rice Paddy and Competing Crops

- Resource allocation among competing enterprises is primarily guided by economic considerations as reflected in their gross cost, gross income, gross margin, net income, output-input ratio, etc. Rice, a major 'kharif' crop, competes with cotton for land, water and other farm resources in the areas where cultivation of both crops is technically feasible.
- Basmati's performance in Punjab in terms of returns to overall investment has been slightly lower than seed cotton. However, in terms of crop duration Basmati has performed better than seed cotton. IRRI paddy in Punjab also could not perform against seed cotton in any of the economic indicators analyzed and cotton outcompeted the earlier comprehensively, except crop duration.
- In Sindh, IRRI paddy farming has shown slightly better results in terms of returns to overall investment against seed cotton. In context of indirect competition with sugarcane, the economic position of IRRI+ wheat rotation is healthier than sugarcane in terms of returns to crop duration.

5. Real Prices

- Nominal market price of basmati paddy decreased by 8.0% in 2020-21 against the previous year.
- In real terms, the real market price of basmati paddy in the Punjab exceeded the base year price during the period between 2015-16 and 2019-20.

The nominal market price of IRRI paddy in Sindh during the post-harvest season of 2015-16 has increased to in 2020-21, indicating overall increase of 76.57 per cent. It also exceeded the base year real market price whole time during the reference period.

6. World Situation

- World production of rice in 2021-22 projected stood at 511 million tonnes which is 1.2% higher than the previous year 2020-21 estimated production (505 Mill. Tonnes).
- ➢ World rice trade during 2020-21 is reported at 46 million tonnes which is higher than the 2019-20 and projected to 47 million tonnes in 2021-22.
- Global trade in rice reported at 46 million tonnes in 2020-21 is projected to increase to 47 million tonnes in 2021-22.
- According to 2019 data, Pakistan lies at number 10th in terms of area under rice varieties and in terms of production in the world. But in yield, Pakistan is far behind other rice producing countries and holds 61th position in the world.
- In terms of global production of rice, China (main land) is on the top with 139.74 million tonnes followed by India with 118.43 million tonnes and Indonesia with 36.40 million tonnes.
- ➢ In terms of yield, Australia lies at the top with 5847 kg/ha, followed by Tajikistan with 5725 and USA+Egypt with 5582 kg/hect while Pakistan has 2442 kg/hectare.

7. Export Parity Prices

- During 2020-21 the average FOB Karachi price of basmati rice is reported at US\$ 915.09 per tonne. On the basis of these prices export parity price of basmati paddy in the domestic market of Pakistan approximates to Rs 2923 per 40 kg.
- Average FOB Karachi price of IRRI rice during the referred period is at US\$ 478.61 per tonne. The equivalent export parity price of IRRI paddy in the domestic market estimates Rs. 1849 per 40 kg.

8. Economic Efficiency

- Economic efficiency of resources used in rice production has been evaluated by estimating Nominal Protection Coefficient (NPC), Effective Protection Coefficient (EPC) and Domestic Resource Cost (DRC).
- Basmati growers in Pakistan are implicitly taxed as NPC estimates have been less than one during the period 2016-17 through 2020-21. Similarly, EPC value for basmati paddy in Punjab also remained less than one during the referred period.

- In case of IRRI rice in Sindh, NPCs and EPCs both of last three years (2018-19 and 2020-21) also remained less than one showing some implicit taxed to the IRRI growers in Sindh.
- DRC indicates the opportunity cost of domestic resource used in the production of a commodity. The DRC less than one indicate a commodity system having comparative advantage and vice versa.
- DRCs for basmati rice have been less than one during the period under review implying that Pakistan has comparative advantage in basmati production.
- DRCs for IRRI paddy in Sindh remained less than one during the period under review (2016-17 exception), indicating comparative advantage for Sindh in IRRI rice for export.

10. Policy Options

Based on the analysis of relevant factors covered in the main text of this Report, likely indicative price policy options for rice paddy 2021-22 crop are presented below:

	Basis	Worked back price of Rice paddy at mill-gate
		(Rs./40 Kg)
А.	Export parity prices based on actual Fob (Karachi) prices of Pakistani basmati and IRRI rice:	
	i) Basmati June, 2021 2020-21	2819 2923
	ii) IRRI	
	June, 20212020-21	1827 1849
B.	Domestic market price of rice paddy	
	during Nov-Dec 2020-21 i) Basmati Punjab	2015
	ii) IRRI-6 Sindh	1519
C.	Cost of production at market level for 2021-22 Crop	
	i) Basmati (Punjab)	1875
	i) IRRI (Sindh)	1102

Recommendations

In view of the economic analysis of different factors bearing on price of Basmati and IRRI rice paddy, comments of the participants of API committee on rice paddy held at API, farmers' feedback assembled through the field survey carried out for paddy 2021-22 crop policy by the API. The following suggestions are advanced:

a. Indicative price of rice paddy for 2021-22 crop

- In view of increase in cost of production of paddy, it is suggested that the government may consider announcement of indicative price of Basmati and IRRI paddy with a reasonable profit margin to sustain the crop.
- Minimize the prices of pesticides by withdrawing GST.
- API suggests to give subsidy on fertilizer to subside inflationary effect on rice crop.
- In view of importance of free market and involvement of private sector, actual incentive to paddy growers should come through free play of the market forces.
- Government policy for promoting role of 'service providers' may be strengthened for wide spread of advance production technology in rice cultivation.

b. Improving productivity

- For promoting use of certified seed of rice, Provincial Seed Councils should be taken on board.
- Laser land levelers may be subsidized to promote its use. This may significantly reduce cost of irrigation.
- Concerted efforts are required to develop rice varieties suitable for dry cultivation.
- Monitoring role of Provincial Department of Agriculture (Extension) for curbing adulteration in pesticides needs to be invigorated.
- Portable dryers may be subsidized to ensure supply of quality rice in the market.

- Price of certified seed both local and imported must be closely monitored and controlled.
- Role of Department of Agriculture (Extension) may be strengthened for promoting balanced use of fertilizer.

c. Improving quality and marketing

- Par boiled steaming technology of rice may be encouraged under supervision of qualified technician for standardizing quality of rice.
- Performance of Provincial Crop Reporting Service (CRS) needs to be enhanced by providing mini threshers (portable) for measuring yield of rice paddy.
- Under WTO Rules considerable subsidy is permissible for undertaking research. It is suggested to advance more funds for evolving new hybrid varieties of rice.

Abdul Karim Director General

RICE POLICY ANALYSIS FOR 2021-22 CROP

INTRODUCTION

Rice plays an important role in Pakistan's agrarian economy. It is second staple food of the country. It also makes significant contribution in the foreign exchange earnings of the country. Rice industry is an important source of employment and income for rural people.

2. Rice accounts for 3.5% of the value added in agriculture and 0.7% of GDP (Economic Survey 2020-21). Area under rice during 2020-21 was 3.336 million hectares. Rice production in the country consists of Basmati, IRRI and 'Other' varieties. All these cumulatively turned out 8.419 million tonnes during 2020-21.

3. Rice is cultivated in all of the four provinces at varying levels of production. Basmati is long grain aromatic variety mainly produced in Punjab while Sindh leads in coarse (IRRI) varieties. The crop also provides feed for livestock in the form of rice straw and husk. It is also used as a raw material in the manufacturing industry.

4. Rice production was at its lowest ebb (4.823 Mill. Tonne) during 2010-11. Since 2010-11 onward, rice production has increased in a fluctuating manner and stood at 8.419 million tonnes in 2020-21. During 2020-21, rice was cultivated on an area of 3336 thousand hectares, 9.9% higher than the last year's area of 3034 thousand hectares. Country production stood at 8419.3 thousand tonnes against the target of 7990.0 thousand tonnes, showing an excess of 5.4% against the target. Thus 2020-21 production was slightly higher than the 2019-20 production by 13.6%. This production turnover happened mainly due to increase in area and yield by 9.9% and 3.3%, respectively.

5. There is a dire need to protect Pakistani rice exports and invest in research, pest eradication, storage, improvement in yield, develop international demanded varieties and have to keep it up by having GAP (Good Agriculture Practice) certification at farm level. The efforts should be made that our rice markets remain intact.

6. This report covers different aspects of the paddy extending from production to export. Necessary quantitative analysis is conducted on each aspect to draw important implications for making price policy suggestions for the 2021-22 crop.

7. Section-1 'Introduction' is preceded by summary of findings and recommendations. Section-2 gives sowing and transplanting time of rice (paddy) in Pakistan. Performance of the 2020-21 crop is reviewed in Section-3 while Section-4 is on domestic demand, supply and price situation of rice which is followed by Section-5 presenting cost of production of rice (paddy) for 2021-22 crop. Section-6 of the report is on economics of rice (paddy) and competing crops. Paddy prices in real/ nominal terms are analyzed in Section-7. It covers prices for both basmati and IRRI varieties. Section-8 deals with world supply, demand, stocks, trade and international prices of milled rice. Analysis regarding rice export from Pakistan during 2019-20 is presented in Section-9 of the report. Section-10 is assigned to analyze and describe economic efficiency in rice production in Pakistan. Section-11 gives rice yield among competing countries. Yield potential of domestic varieties of rice is assessed in Section-12. Next Section-13 casts on availability of improved seed of rice (paddy) during 2019-20 and last section-14 is attributed to acknowledgements.

2. SOWING AND TRANSPLANTING TIME OF RICE PADDY

8. Rice crop in Pakistan is mostly sown by transplanting of seedlings raised in nurseries. Direct seeding is also practiced but on a limited scale. Sowing time of nurseries and transplanting differ by variety and region. The recommended sowing time of nurseries and their transplanting in various regions are given in Table-1.

Province	Variety	Tim	e for
	-	Sowing nursery	Transplanting
Punjab	Super Basmati	20 May to 7 June	20 June to 7 July
	Other Basmati	1 June to 20 June	1 July to 31 July
	IRRI	20 May to 7 June	20 June to 7 July
Sindh			
Upper Sindh	IRRI-6, Sada Hayat	8 May to 15 June	8 June to 15 July
	DR-82/92	23 May to 30 June	23 June to 31 July
	DR-83	16 June to 15 July	16 July to 15 August
Lower Sindh	IRRI-6, Sada Hayat	16 April to 15 May	16 May to 15 June
	DR-82/92	8 May to 22 June	8 June to 22 July
	DR-83	1 June to 7 July	1 July to 8 August
КРК			
Plains All varieties		1 May to 31 May	1 June to end of June
Hilly areas	All varieties	1 May to 20 May	3 rd week of May to
			end of June
Balochistan	All varieties	20 May to 30 June	20 June to 30 July

3. **REVIEW OF 2020-21 CROP**

3.1 Provincial Shares in Area and Production of Rice (Paddy)

9. During the period (2018-19 to 2020-21), average annual production of rice worked out at 7.678 million tonnes from average area of 3.060 million hectares (7.561 million acres), (Table-2). Variety-wise break-up of rice production (Table-2) shows that Punjab having best suited agro climatic conditions in production of basmati rice is the sole producer of basmati rice in the country. In total production of IRRI rice; Punjab, Sindh, and Balochistan contributed 22.2, 43.9 and 33.9 percent respectively. In 'Other' varieties category, shares of Punjab, Sindh and KPK are 26.7, 67.6 and 5.8 percent respectively.

10. Provincial shares of Punjab, Sindh, KPK and Balochistan in area under rice crop are 68.9, 23.7, 2.1 and 5.3 percent respectively. Basmati accounts for 54.5 percent while IRRI and 'Others' varieties carried 17.8 and 27.7 percent of the total area.

	17 to 2020-21 Crops								
Variety	Pakistan		Punjab	Sindh	КРК	Balochistan			
<u>Area</u> (000 hectares)	%			-%				
Total	3059.8 (7561.3)	100.0	68.9	23.7	2.1	5.3			
Basmati	1668.9 (4123.9)	54.5	100.0	-	-	-			
IRRI	543.4 (1342.8)	17.8	24.4	45.9	-	29.7			
Other	847.6 (2094.5)	27.7	36.3	56.1	7.6	-

19 to 2020-21 Crops

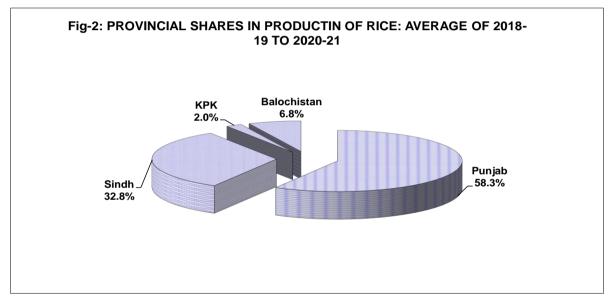

Note: *Figures in parenthesis are thousand acres

Source: *Worked out from data in Annex-I

3.2 Overtime Changes in Area, Yield and Production of Rice

11. Area under rice crop during the period between 2010-11 and 2020-21 ranged between 2.309 and 3.336 million hectares (Annex-I) which in acre units ranged between 5.705 and 8.242 million acres (Annex-1A). During the same period production oscillated between 4.823 and 8.419 million tonnes (Annex-I) while yield during this period fluctuated between 2039 and 252 kg per hectare. Long and short term changes in area, yield and production of rice are discussed below:

3.3 Long Term Changes (Growth Rates): 2010-11 to 2020-21

12. During the decade ending 2020-21, production of rice at country level is estimated to have increased @ 4.2 percent per annum as a cumulative effect of increase in yield @ 1.4 percent and area @ 2.8 percent. These data are given in Table-3.

- Punjab

13. Annual growth of rice production in Punjab during the period 2010-11 to 2020-21 remained 3.5 percent as a result of 1.2 percent per annum increase in yield and 2.3 percent per annum in area. Production of basmati rice during the same period increased by 6.6 percent per annum mainly due to 4.5 and 2.1 percent per annum increase in area and yield respectively. Production of IRRI rice, during the reference period decreased by 4.3 percent annually, due to 4.8 percent decrease in area, however, 0.5 percent escalations in yield.

Production of varieties in 'Other' category also decreased @ 1.8 percent per annum mainly due to decrease in area @ 2.4 percent, but, 0.7 percent improvement in yield.

- Sindh

14. In Sindh, where only coarse rice varieties are cultivated, rice production during the period under reference is estimated to have increased @ 4.7 percent annually due to 4.9 percent growth in area despite of 0.2 percent down in yield.

Country/Province	Variety	Area	Yield	Production		
-		F	Per cent per annum			
Pakistan	All varieties	2.8	1.4	4.2		
	Basmati	4.5	2.1	6.6		
	IRRI	-2.7	0.1	-2.5		
	Others	5.0	2.6	7.7		
Punjab	All varieties	2.3	1.2	3.5		
	Basmati	4.5	2.1	6.6		
	IRRI	-4.8	0.5	-4.3		
	Others	-2.4	0.7	-1.8		
Sindh	All varieties	4.9	-0.2	4.7		
	IRRI	-3.6	-2.8	-6.4		
	Others	15.0	0.5	15.6		
КРК	All varieties	3.6	3.7	7.4		
Balochistan	All varieties	3.0	7.6	10.8		

Table-3:	Average Annual Growth Rate of Area, Yield and Production of
	Rice: 2010-11 to 2020-21

Note: The growth rates have been worked out by estimating the equation $Y=a(1+r)^x$ through Ordinary Least Squares (OLS) Method from the data given in Annex-I.

KPK

15. In KPK, production of rice during the referred period increased i.e. 7.4 percent per annum due to only surge in area and yield @ 3.6 and 3.7 percent per annum respectively.

- Baluchistan

16, In Balochistan, rice production during the period under reference has recorded positive growth rate 10.8 percent due to also increase in area @ 3.0 percent and rise in yield @ 7.6 percent per annum.

3.4 Short Term Changes (Growth Rates): 2019-20 to 2020-21

17. According to the Final estimates, rice production estimated at 8.419 million tonnes in 2020-21 is 13.6 percent higher than last year production of 7.414 million tonnes (Table-4). The production increased mainly due to increase in area and yield by 9.9 and 3.3 percent. Changes in area, yield and production by province and by variety in 2020-21 in relation to 2019-20 are given in Table-4.

- Punjab

18. In Punjab, overall production of rice shows 27.9 percent increase during 2020-21 as compared with 2019-20. Rise in production occurred mainly due to 18.0 percent increase in area. Production of basmati increased by 23.8 percent due to 12.6 and 9.9 percent increase in

area and yield respectively. IRRI varieties show increase of 93.8 percent due to expansion both in area and yield by 89.4 and 2.1 percent respectively. Production of 'Other' rice also increased in 2020-21 by 25.4 percent due to 26.9 percent increase in area; however the yield decreased @1.4 percent.

- Sindh

19. In Sindh, overall production of rice decreased in 2020-21 by 6.2 percent mainly due to area decrease of 8.6 percent however, yield has increased by 2.6 percent against the last year. Production of IRRI variety increased by 13.7 percent mainly due to yield increased by 31.1 percent however the area decreased by 13.3 percent against the last year. Production of 'Other' rice decreased in 2020-21 by 12.2 percent over the previous year. The reason is area and yield reduction by 6.3 and 6.4 percent.

- Baluchistan

20. In Balochistan, where IRRI variety is grown, production in 2020-21 crop increased by 1.6 percent mainly due to increase in area by 1.8 percent although yield decreased by 0.2 percent against the last year.

Table-4:	Area, Yield and Production of Rice by Variety: 2019-20 and 2020-21 Crop								
Country/	Country/ Area		Change	Yie	eld	Change	Produ	Production

Source: Annex-I

4 TARGETS VS ACHIEVEMENTS OF 2020-21 CROP

21. Federal Committee on Agriculture (FCA) fixed area target for 2020-21 rice crop at 2.957 million hectares and production target at 7.990 million tonnes in its meeting of October 22, 2020 held at Islamabad. So far as 2020-21 crop achievements are concerned, Provincial Agriculture Departments have reported its final estimate of area at 3.336 million hectares is higher than the respective target by 12.8 percent and production at 8.419 million tonnes that is also higher than the respective targets by 5.4 percent (Table-5).

	Α	rea	Deviation	Y	ield	Deviation	Prod	uction	Deviation
Country/ Province	Target	Achieve- ment	from target	Target	Achieve- ment	from Target	Target	Achieve- ment	from target
	000 hectares %		%	kgs p	er hectare	%	000 tonnes		%
Pakistan	2957.0	3335.5	12.8	2702.1	2524.1	-6.6	7990.0	8419.3	5.4
Punjab	1900.0	2394.4	26.0	2210.5	2213.9	0.2	4200.0	5301.0	26.2
Sindh	800.0	709.0	-11.4	3750.0	3407.9	-9.1	3000.0	2416.1	-19.5
КРК	67.0	64.9	-3.1	2835.8	2442.2	-13.9	190.0	158.5	-16.6
Baluchistan	190.0	167.2	-12.0	3157.9	3251.8	3.0	600.0	543.7	-9.4

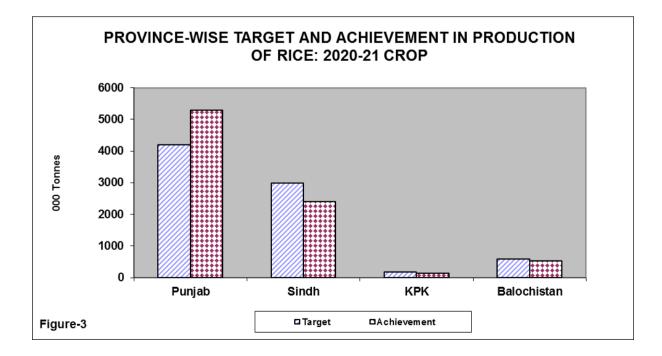

Table-5:Targets and Estimated Achievements of Area, Yield and Production
of Rice: 2020-21 Crop

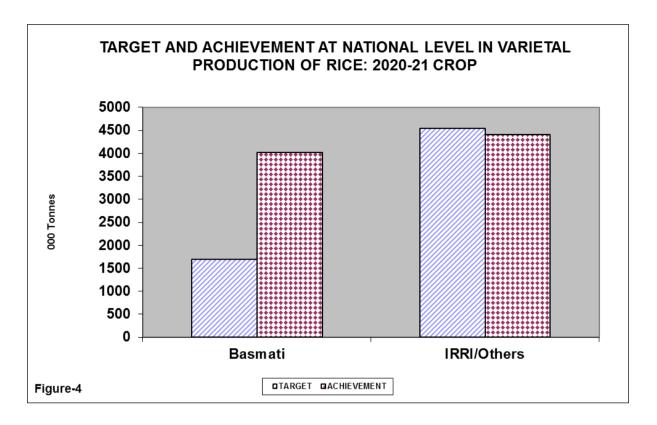

Sources:

1. For targets: Minutes of the Federal Committee on Agriculture (FCA) Meeting held in October 22, 2020 in Islamabad

2. For achievements: Derived from Annex-I

22. Area and production targets of the 2020-21 crop by province wise presented in Table-5. In Punjab area target remained exceed by 26.0 percent, but Sindh, KPK and Baluchistan remained short by 11.4, 3.1 and 12.0 percent restrictively. Production of Punjab also remained higher than respective target by 26.2 percent; however, Sindh, KPK and Baluchistan were also less than the target by 19.5, 16.6 and 9.4 percent respectively. The Punjab and Baluchistan yield increased the target by 0.2 and 3.0 percent respectively. However, Sindh and KPK yield target could not be achieved and that were down by 9.1 and 13.9 percent respectively.

5. IMPORTANT RICE PRODUCING DISTRICTS

23. Districts based on 2018-19 to 2020-21 average production (with varietal break-up) are arranged in descending order in Annex-II. Districts producing more than 50 thousand tonnes of rice include Gujranwala, Sheikhupura, Okara, Hafizabad, Sialkot, Nankana Sahib, Jhang, Bahawalnagar, Pakpattan, Kasur, M.B. Din, Narowal, T.T. Singh, D.G. Khan, Chiniot, Vehari, Khanewal, Muzaffargarh, Faisalabad, Sahiwal, Lahore, Sargodha, Multan and Gujrat from Punjab; Badin, Larkana, Jacobabad, Shikarpur, Qamber, Kashmore, Thatta, Dadu and Tando Muhammad Khan from Sindh and Jafarabad and Nasirabad from Balochistan. These 35 districts collectively produced 94.7% of total production of rice in the country. Main basmati producing districts which contribute about 71.9% of total basmati in the country are Sheikhupura, Hafizabad, Sialkot, Okara, Nankana Sahib, Jhang, Gujranwala, Pakpattan, Bahawalnagar, Narowal, M.B. Din, and T.T. Singh, While 58.8% of total IRRI rice production is contributed by Larkana, Thatta, Qambar, Nasirabad and Jafarabad. These districts are above 100 thousand tonnes producer (Annex-III).

6. DOMESTIC DEMAND, SUPPLY OF RICE AND PRICES OF RICE PADDY

6.1 Domestic Demand and Supply of Rice

24. Rice is an important food as well as cash crop. It is the second main staple food crop after wheat and the second major exportable commodity after cotton.

25. Based on annual per capita availability of rice averaging at 14.32 kgs during the period 2017-18 to 2019-20 (Annex-III), the domestic consumption requirement in 2020-21 for population of 222.22 million has been estimated at 3187 thousand tones. According to second estimates the country has produced 8419 thousand tonnes rice during 2020-21 crop. After deduction of 505 thousand tons for the seed and wastage allowance @ 6 per cent of the production, the net available rice for consumption and trade comes to 7914 thousand tons, hence Pakistan has an export surplus of 4727 thousand tones during 2020-21.

6.2 Domestic Prices of Basmati Rice Paddy

26. During current season 2020-21, the farmers of Basmati paddy have fetched a less price as compared to last year. The wholesale prices of basmati super paddy in major markets in colar area (area designated/suitable for aromatic basmati rice) has been presented in Table-6. The price of basmati super paddy ranged between Rs 1839 per 40 kgs in Hafizabad market during November 2020 and Rs 2248 per 40 kgs in Mandi Bahudin market during December 2020. The season average prices of basmati super (paddy) in the Punjab have ranged between Rs 1844 and Rs 2104 per 40 kgs.

S.No	Markets	Nov	Dec	Average
			Rs per 40kgs	
1	Sheikhupura	2031	2088	2059
2	Hafizabad	1839	1850	1844
3	Nankana Sahib	1943		1943
4	Sialkot	1918	2078	1998
5	Gujranwala	2079	2072	2076
6	Narowal	1925	2243	2084
7 M.B.Din		1960	2248	2104
	Average	1956	2096	2015

Producer Area Markets of the Punjab: Nov-Dec,2020-21 crop

Source: Directorate of Agriculture (E&M) Punjab, Lahore.

6.3 Domestic Prices of Kainat Paddy

27. The data regarding wholesale price of extra-long and pearl white kainat paddy in main producing area markets of Punjab is presented in Table-7. The price of kainat paddy has also followed the prices of basmati paddy. The price of kainat paddy ranged between Rs 1810 per 40 kgs in Chiniot market during December 2020 and Rs 2616 per 40 kgs in Pakpattan market during January 21. The season average prices of Kinat (paddy) in the Punjab have ranged between Rs 1858 and Rs 2399 per 40 kgs.

Area Warkets of the 1 unjab. Oct 2020 to Jan 2021

28. The average wholesale market prices of IRRI Paddy in Sindh are depicted in (Table-8). During the current season, the farmers have received extra ordinary price of IRRI-6 paddy. The prices have ranged between Rs 1100 to Rs 1850/ 40 kgs. Both the lowest and the highest prices were observed in Larkana market during September and November, 2020. The seasonal average during 2020-21 crop ranged between Rs 1357 to Rs 1633 per 40kgs.

7. COST OF PRODUCTION OF RICE PADDY

29. Cost of production (COP) is one of the important factors in making price suggestion for farm commodities. However, its estimation involves a number of conceptual problems and practical difficulties. In this regard, wide variations in the inputs use level, technology adoption and diverse farming practices resulting in varying yield levels are worth mentioning.

30. Cost of production estimates for Punjab and Sindh for various varietals groups of rice paddy for the 2021-22 crop have been updated by adapting the input-output parameters as used in the Price Policy Report for Rice Paddy 2020-21 crop in conjunction with the latest prices and rates of different inputs and cultural operations collected from main rice producing districts of Punjab and Sindh provinces. The prices of inputs and custom hiring rates of field operations were updated with the information provided by the participants in the API meeting held at Islamabad and annual field survey conducted by the API teams in the important rice growing areas of Punjab and Sindh during March 2021. COP estimates for rice paddy for the Punjab and Sindh are detailed in Annex-IV to V, while summary of these is shown in Table-9.

7.1 Average farmer's expected cost of production of rice paddy for 2021-22 crop against 2020-21

31. Expected cost of production estimates of basmati for Punjab and IRRI for Sindh in 2021-22 versus 2020-21 are summarized and presented in the Table-9.

0		•		-
Item	Unit	Cost e	stimate	Change in

Source: Annex-V to VII				

Table-9: Average Farmer's Cost of Production of Rice Paddy: 2020-21 and 2021-22 Crops

Source: Annex-V to VII

Figures in last column may show slight difference due to rounding of decimals Notes: in column [1] and column [2].

- Punjab

Basmati

32. According to analysis presented in the above referred table, net cost of growing one acre of basmati paddy at the current inputs prices and hiring rates of different cultural operations prevailing in Punjab during 2021-22 crop year is anticipated at Rs 65016 inclusive land rent. Based on the average yield of 1400 kg per acre, farm level cost of production works out to Rs 1858 per 40 kg. Adding marketing cost @ Rs 60 per 40 kg, cost of production till harvest and disposal in the market or at the Sheller would be Rs. 1918 per 40 kg - more by Rs 172 per 40 kgs than the last year corresponding cost estimated at 1746 per 40 kg.

IRRI

33. According to analysis presented in the above referred table, net cost of growing one acre of irri paddy at the current inputs prices and hiring rates of different cultural operations prevailing in Punjab during 2021-22 crop year is anticipated at Rs 6384.7 inclusive land rent. Based on the average yield of 2000 kg per acre, farm level cost of production works out to Rs 1277 per 40 kg. Adding marketing cost @ Rs 60 per 40 kg, cost of production till harvest and disposal in the market or at the Sheller would be Rs. 1337 per 40 kg - more by Rs 151 per 40 kg than the last year corresponding cost estimated at 1185 per 40 kg.

- Sindh

34. In Sindh, net cost of cultivation for one acre of IRRI/ hybrid paddy during 2021-22 crop year is expected to cost Rs 57322 inclusive land rent. Based on 2020-21 average yield of 2200 kg per acre – as reported by the farmers during the API field survey, cost of production at farm level would be Rs 1042 per 40 kg. Including marketing expenses @ Rs 60 per 40 kg, the cost of production to deliver at Sheller/ market would be Rs 1182 per 40 kgs, against Rs 1185/ 40 kg in 2020-21 - more by Rs 121 per 40 kgs.

35. Main factors behind these changes are increased in diesel price during 2021, increased in fertilizer prices i.e DAP from Rs 3600 to Rs 6500.

7.2 Cost of Major Operations/Inputs

36. Break-up of costs of various field operations and farm inputs in the gross cost of cultivation of rice paddy in Punjab and Sindh during 2020-21 and expected in 2021-22 (with respective changes) over the previous year are presented in Table-10.

- Punjab

Basmati

37. In Table-10 cost of production of paddy is consolidated under broader headings rather than individual items. Analysis is presented for Punjab and Sindh provinces for basmati and IRRI varieties. The data comprise major operations/ inputs of cost of production of paddy. It helps us identify where policy support can be more beneficial to paddy growers.

38. Figures in parenthesis in Table-10 show respective percentages. It may be seen from the data that major component of the cost of basmati paddy production is land rent (23%). Next higher item is fertilizer inclusive farm yard manure (FMY) and irrigation. Expenditure on irrigation mainly comes from tube well water which supplements the canal water. Fertilizer carries 18% of the gross cost and thus is a crucial item in the cost of production estimate. All other cost items carry lesser weight in the gross cost of production of paddy.

	2020-21	2021-22	Change in 2021-22
Operations/inputs	Crop	Crop	over 2020-21
	(Rs	/acre)	
Punjab (Basmati)		1	
1. Land preparation	8789(14)	9673(13)	884
2. Nursery, uprooting and transplanting	7341(11)	8090(11)	749
3. Weeding	633(1)	690(1)	58

9. Others	4706(7)	5701(8)	995
10. Gross cost	62924(100)	70847(100)	6423
Sindh (IRRI)			
1. Land preparation	6500(13)	7150(12)	650
2. Nursery/uprooting and transplanting	7300(15)	9000(15)	1700
3. Weeding	1260(3)	1440(2)	180
4. Plant protection	979(2)	1500(2)	521
5. Irrigation	3520(7)	3956(6)	436
6. Fertilizer including FYM	8778(17)	11834(19)	3056
7. Land rent	15000(30)	16500(27)	
8. Harvesting and threshing etc	2250(4)	4000(7)	1750
9. Others	4756(9)	5943(10)	1187
10. Gross cost	50343(100)	61322(100)	10979

Table-10: Cost of major operations/inputs of rice paddy: 2020-21 and 2021-22 crops

Notes: Others' include cost of bund making, mark-up, management, land tax, land revenue and drainage cess.

- Figures in parenthesis are percent shares in total cost of cultivation.
- Rounding off figures may result in slight differences

IRRI

39. Figures in parenthesis in Table-10 show respective percentages. It may be seen from the data that major component of the cost of irri paddy production is land rent (23%). Next followed by higher item is fertilizer inclusive farm yard manure (FMY) 19% followed by irrigation expenditure (18%). Expenditure on irrigation mainly comes from tube well water which supplements the canal water. Fertilizer carries 19% of the gross cost and thus is a crucial item in the cost of production estimate. All other cost items carry lesser weight in the gross cost of production of paddy.

- Sindh

IRRI

40. For IRRI paddy grown in Sindh, again land rent cost is the major cost component (27%), followed by fertilizer inclusive farm yard manure (farm yard manure) (19%), Nursery/uprooting and transplanting (15%) and land preparation (12%). It needs to be noted that in all of the three categories land rent, land preparation and fertilizer emerges as major components of the cost of production of paddy. Thus these may be suggested for giving subsidy etc for minimizing cost of production of this crop.

41. Last column of the above referred Table indicates overtime increase or decrease in the cost of production of basmati and IRRI varieties against the last year. The data identify potential inputs and cultural operations whose cost may be reduced by providing subsidy to minimize cost of production of paddy. It may be assessed from the data that irrigation expenditure, land preparation costs and fertilizer cost may be reduced by subsidizing electricity for agricultural tube wells, removing GST on fertilizer and reducing price of diesel.

8. ECONOMICS OF RICE PADDY AND COMPETING CROPS

42. Resource allocation among competing enterprises is primarily guided by economic considerations as reflected in their gross cost, gross income, gross margin, net income, output-input ratio, etc. Rice, a major 'kharif' crop, competes with cotton for land, water and other farm resources in the areas where cultivation of both crops is technically feasible. The coarse and fine varieties of rice may also compete among themselves. Rice also faces indirect competition from sugarcane, an annual crop, which occupies the land over the year.

43. The economics of rice and competing crops has been analyzed in terms of inputoutput prices paid and received by the growers for the 2020-21 crops. A summary of the relevant economic indicators emerging from the analysis is presented in Table-11 for the Punjab and Table-12 for Sindh. Also, the Output-Input ratios have been graphically presented in Fig-5 and Fig-6 for both the provinces. Details of the analysis are provided in Annex-VII.

- Punjab

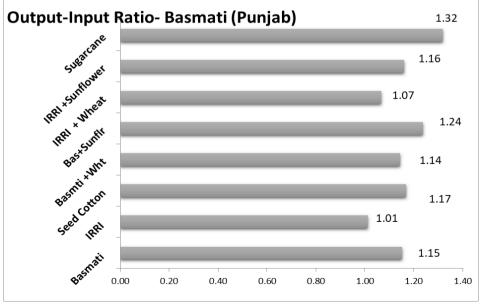

44. Basmati's performance in Punjab in terms of returns to overall investment has been slightly lower than seed cotton. Similarly, in terms of purchased inputs and irrigation water, Basmati's returns to farmer for the farm investment were much lower than the cotton. However, in terms of crop duration Basmati has performed better than seed cotton.

	Output	Gross revenue per					
Crop/crop combination	Output- input ratio	rupee of purchased inputs cost	day of crop duration	acre-inch of irrigation water used			
	Rupees						
1. Basmati paddy	1.15	2.25	405	1256			
2. IRRI paddy	1.01	2.26	362	1052			
3. Seed Cotton	1.17	3.45	374	4076			
4. Basmati+wheat	1.14	2.71	370	1904			
5. Basmati+sunflower	1.24	2.86	409	1839			
6. IRRI+wheat	1.07	2.75	349	1698			
7. IRRI+sunflower	1.16	2.91	387	1661			
8. Sugarcane	1.32	4.08	411	3376			

Table-11:	Economics of Rice and Competing Crops at Prices Realized by the Paddy
	Growers in the Punjab: 2020-21 Crops

Source: Annex-VII.

45. IRRI paddy in Punjab also could not perform against seed cotton in any of the economic indicators analyzed and cotton out-competed the earlier comprehensively. Not only that both Basmati and IRRI paddy were out performed by seed cotton, the IRRI even hardly could gain break-even point and its returns to overall investment i.e output-input ratio, were slightly above than 1, which indicates that farmer's costs have slightly met in cultivating IRRI paddy.

46. In case of indirect competition, the **B**asmati combinations with Wheat and Sunflower though show better returns, however, still lag far behind sugarcane terms of in output-input ratio. Sugarcane, based

Fig-5: Output-input Ratio in Punjab for Basmati Paddy

on the market price received by the farmers, has performed much better against the earlier in terms of all the indicators IRRI combinations remained considerably lower in respect of all the economic indicators analyzed. However, the IRRI combination with Wheat gained a marginal edge over Sunflower combinations in terms of returns to purchased inputs.

- Sindh

47. In Sindh, IRRI paddy farming has shown considerably better results in terms of returns to overall investment and in the rest of the economic criteria except Irrigation water, against seed cotton. This situation indicates that the rice growers have been able to get rewarding prices for their produce, enabling them to compete with cotton successfully. However, IRRI is lagging behand cotton in terms of returns to irrigation water, where the later out-competes the earlier significantly.

	Output-	Gross revenue per					
Crop/crop combination	input ratio	rupee of purchased inputs cost	day of crop duration	acre-inch of irrigation water used			
Rupees							
1. IRRI paddy	1.51	3.88	424	1362			
2. Seed Cotton	1.14	3.29	385	5135			
3. IRRI+wheat	1.39	3.93	406	2151			
4. IRRI+sunflower	1.42	3.76	356	1643			
5. Sugarcane	1.32	4.10	313	2152			

Table-12:	Economics of IRRI Paddy and Competing Crops at Prices Realized by the
	Growers in Sindh: 2020-21 Crops

Source: Annex-VII.

48. In context of indirect competition with sugarcane, the economic position of IRRI's combinations with wheat and sunflower is healthier than sugarcane in terms of output-input ratio and returns to crop duration. However, the performance of these combinations has been lower to the sugarcane in terms of the remaining indicators.

49. The above situation portrays an encouraging situation for rice growers in Sindh, while in Punjab, they have yet to achieve efficiency through improved productivity and fetching better prices.

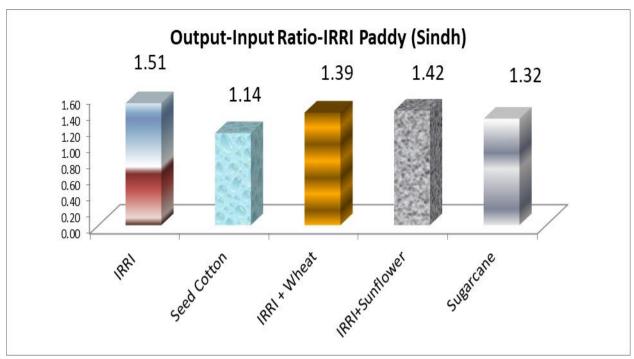

Fig-6: Output-input Ratio in Sindh for IRRI Paddy

9. NOMINAL AND REAL MARKET PRICES OF BASMATI AND IRRI PADDY: 2015-16 to 2020-21

50. To analyze the overtime changes in the purchasing power of basmati (Punjab) and IRRI paddy (Sindh), the nominal and real market prices of rice paddy for the period 2015-16 to 2020-21 crops were deflated by the Consumer Price Index (CPI), the most common measures of inflation in the economy. The results are given in Table-13 and also depicted in Figs-7 and 8.

51. It is important to note from the above analysis that due to increasing trend of general inflation in the economy, the gap between nominal and real prices, both of Basmati and IRRI paddy is widening every year. It shows the deterioration of the purchasing power of the commodity overtime in real terms. Variety-wise detail of basmati and IRRI paddy is discussed in the following paragraphs.

9.1 Basmati Paddy (Punjab)

52. The data in Table-13 reveals that the nominal market price of Basmati paddy has evidenced 58.1 per cent overall increase against the base year during the period under review while its real value improved by only 13 per cent. The major reason for this slow increasing trend in the real purchasing power of the crop is the 40.06 per cent general inflation observed in the economy during the same period.

2013-10 to 2020-21									
Crop year	Nominal Ma	rket Prices	Consumer	Real Mar	ket Prices				
	Basmati	IRRI-6	Price Index	Basmati	IRRI-6				
	(Punjab)	(Sindh)	(CPI)						
1	2	3	4	5=(2/4)*100	6=(3/4)*100				
	Rs per 4	40 kgs	2015-16=100	Rs per	40 kgs				
2015-16	1320	713	100.00	1320	713				
2016-17	1557	832	104.81	1485	793				
2017-18	1604	898	109.72	1462	818				
2018-19	1834	1121	116.35	1576	963				
2019-20	2268	1225	130.33	1740	940				
2020-21	2087	1259	140.06	1490	899				
Note: The market prices are the average wholesale prices prevailed during the post-harvest season in the main producer area markets of the Punjab for basmati and of Sindh for IRRI paddy.									
Sources:	i) Econor	nic Survey of F	Pakistan, 2020-21						

Table-13:Nominal and Real Market Prices of Basmati and IRRI-6 Paddy:
2015-16 to 2020-21

ii) CPI 2007-08 base year series converted into base year 2015-16.

iii) Directorate of Agriculture, (E&M), Lahore, Punjab.

iv) Directorate of Agriculture Farms and Major Crops Development, Hyderabad, Sindh.

53. For the entire period under review, the real market price remained above the base year level consecutively up to now. About 9 per cent the nominal market prices lower in 2020-21 at per cent as compared to the last year. The year 2020-21 was relatively both for the rice growers as they did fetch highest real prices of Rs 1490 per 40 kgs.

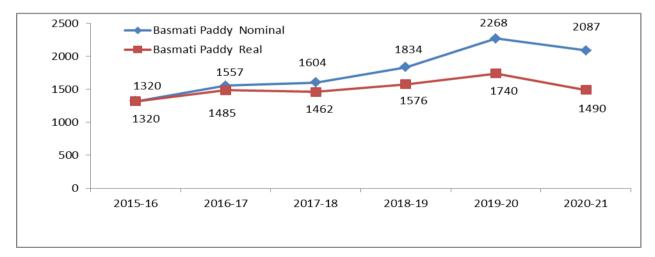

Fig-7: Nominal and Real Market Price of Basmati Paddy in Punjab: 2015-16 to 2020-21

9.2 IRRI Paddy (Sindh)

54. It may be seen from Table-13, that the nominal market price of IRRI paddy in Sindh averaging at Rs 713/- per 40 kgs during the post-harvest season of 2015-16 has increased to

Rs 1259/- per 40 kgs in 2020-21, indicating overall increase of 76.57 per cent. For the rise in CPI by 40.06 per cent, the consequent increase in the real market price of IRRI paddy is estimated at 26.08 per cent from Rs 713/- in base year to Rs 899/- per 40 kgs in 2020-21.

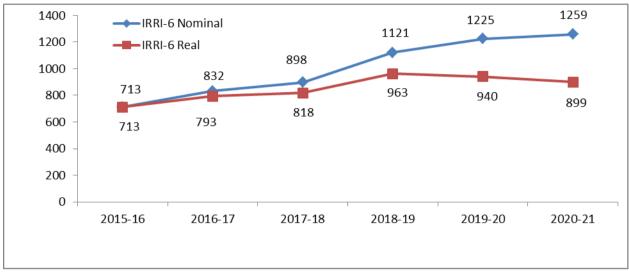

Fig-8: Real Market Price of IRRI-6 in Sindh: 2015-16 to 2020-21

55. The data also reveals that during the whole period in question, the real market prices of IRRI paddy remained above the base year level of Rs.713/- per 40 kg. However, during, 2020-21, the real IRRI prices slightly decrease over last year by 4.36 per cent. The real value of the crop remained higher to base year level throughout the period under review.

10. WORLD SUPPLY, DEMAND, STOCKS, TRADE AND PRICES SITUATION OF MILLED RICE

10.1 World Supply, Demand, Stocks, and Trade

56. The estimated and projected data of production, consumption, stocks and trade of rice reported by the International Grain Council from 2019-20 to 2021-22 is presented in Table-14.

57. The world production of rice in 2020-21 is estimated at 505 million tons, only 6 million tons higher than year 2019-20, accounting for the opening stocks of 173 million tons, total supply works out at 678 million tons, 4 million tons higher than previous year.

58. Rice production in 2021-22 is projected to significantly increase to 511 million tons, 6 million tons higher than in 2020-21; the increase is at par to last year increase. With the addition of opening stocks of 170 million tons, total supply would be at 681 million tons, an increase of 3 million tons during 2021-22. The global consumption is projected to increase from 510 million tons in 2021-22 from 508 million tons in 2020-21. Resultantly the end year stocks are projected to increase from 170 million tons to 171 million tons during 2021-22. The global trade in rice reported at 46 million tons in 2020-21 is projected to slightly increase to 47 million tons in 2021-22.

S.No	Item	2019-20	2020-21 Estimated	2021-22 Projected
			Million	tones
1.	Opening stocks	175	173	170
2.	Production	499	505	511
3.	Total supply (Items 1+2)	674	678	681
4.	Consumption/disappearance	500	508	510
5.	Closing stocks	173	170	171
6.	Trade	44	46	47

Table-14:World Supply, Demand, Stocks and Trade in Rice: 2019-20 to 2021-22

Source: International Grain Council, August 2021.

11. RICE EXPORT FROM PAKISTAN

59. Pakistan is one of the largest exporters of rice with an average share of 8.54 per cent in global rice market during 2017-2019. Export of rice has decreased from 3.38 to 3.02 million tons during 2019-20 over2018-19 in quantity and US\$ 1.73 to 1.64 million in value terms. The reduction observed in course rice.

60. Export of basmati rice has increased by 31.29 per cent in 2019-20 over 2018-19 in quantity and 20.30 per cent in value, while export of coarse rice have decreased by 20.96 per cent in quantity and 138 per cent in value. Region wise export of rice 2019-20 over 2018-19 are given in Table-15.

61. The region-wise statistics revealed that bulk of the basmati rice export were destined to Asian countries (60.19 per cent) followed by European countries (14.91 per cent). Basmati rice during 2019-20 over 2018-19 has increased in Africa 162.82 per cent, Asia by 57.10 per cent, America 58.42 per cent, Oceania 27.85 per cent, while it is decreased in Europe 35.34 per cent, and CIS countries by 5.17 per cent respectively.

62. In case of coarse rice, overall export of coarse rice has decreased by 20.96. The major declined observed in CIS countries by 60.87 per cent, Asia by 42.23 per cent Europe by 38.25 per cent, Africa by 0.21 per but share of these countries in total export is at marginal level except Asian countries The main destinations were African countries 60.54 per cent followed by Asian countries 32.55 per cent.

Region	Basmati Rice	Coarse Rice	Basmati Rice	Coarse Rice	Basma	ati Rice	Coars	e Rice

Source: Annex- X

12. EXPORT PARITY PRICES OF RICE (PADDY)

63. To ascertain export competitiveness of Pakistani rice in the international market export parity prices have been calculated on the basis of actual export prices of both fine and coarse rice. The details of these calculations are given in Annexes--and -- , a summary is given in table-16.

 Table-16: Export Parity Prices of Basmati and IRRI Paddy

	June 2021	2020-21	Average 2019-2021
Items			
A) Export Parity Price of Basmati Paddy			
Average fob Karachi prices (US\$/ton)	883.69	915.09	927.22
Exchange Rate (Rs/US\$)	163.25	163.25	163.25
Average fob Karachi prices (Rs/40Kgs)	5770	5976	6055
Mill-gate price of 40 Kgs paddy	2819S	2923	2964
B) Export Parity Price Of IRRI Paddy			
Average fob (Karachi) prices (US\$/ton)	473.30	478.61	439.12
Exchange Rate (Rs/US\$)	163.25	163.25	163.25
Average fob Karachi prices (Rs/40Kgs)	3091	3125	2867
Mill-gate price of 40 Kgs paddy	1827	1849	1690

13. ECONOMIC EFFICIENCY IN RICE PRODUCTION

64. Economic efficiency in rice production has been evaluated by estimating most frequently used economic parameters i.e Nominal Protection Coefficient (NPC), Effective Protection Coefficient (EPC) and Domestic Resource Cost Coefficient (DRC). To assess the impact of price policy changes on rice producers and Pakistan's comparative advantage in rice production, the analysis is conducted from 2016-17 till 2020-21. NPC, EPC and DRC estimates are produced in Table-16 and background analyses given in Annex-XI to Annex-XII.

13.1 Nominal Protection Coefficient (NPC) under Export Situation

65. NPC is a measure of protection or taxation to the producers of a crop in lieu of open market price of the crop. In this calculation open market price is numerator while social price is denominator. By definition, social price is the export parity price minus marketing cost incurred in shifting the commodity from farm gate to the market.

66. NPC, EPC and DRC coefficients are separately calculated for Basmati and IRRI varieties of rice and produced in Table-17.

Situation					
Province/ Year	NPC	EPC	DRC	US \$ 1= Pak Rs	Domestic Resources Spent (Rs) to earn Forex worth US\$ 1

 Table-17:
 Economic Efficiency Coefficients for Rice in Pakistan under Export Situation

Source: Annex-XI and XII

67. It is observed from the data given in Table-16 that for Basmati grown in Punjab, NPC values have been drastically fluctuating during the reference period. It indicates unstable domestic and international prices of basmati paddy

68. The decisive rule is that if NPC is smaller than one, local producers get price less than the corresponding export parity price and thus are implicitly taxed and vice versa.

69. For IRRI paddy grown in Sindh NPC coefficients have been continuously above one during the period under study except in 2018-19 to 2020-21. It means that on the whole, IRRI paddy growers are protected through the output price policy which induces producers for promoting the crop.

13.2 Effective Protection Coefficient (EPC) under Export Situation

70. Effective Protection Coefficient unlike NPC includes both input and output prices in its calculation. Thus it captures cumulative effect of both input costs and price of the crop on respective growers. In EPC calculation, difference of the crop revenue and traded inputs cost at private price is numerator and difference of the crop revenue and traded inputs cost at social price is denominator. However, it needs to be mentioned that EPC does not consider all input costs rather considers only traded inputs costs – those inputs which are purchased with cash. These are seed, fertilizer, tube well water, machinery (tractor etc). As a general principle if EPC is greater than one, producers of the crop are protected and if it is less than one they are implicitly taxed. In the former situation farmers are induced to produce more while in the later situation development of the crop is discouraged.

71. It is understood from EPC values for Basmati paddy produced in **Table-16** that produce prices of basmati have not been consistent with input prices in Pakistan. These have been highly fluctuating during the reference period. EPC values mentioned in the referred table indicate that basmati growers in Punjab remained implicitly taxed because EPCs were less than one during last five years.

72. EPC values for IRRI paddy in Sindh mentioned in the referred table indicate that IRRI growers in Sindh remained implicitly taxed because EPCs were less than one during last three years.

73. The above analysis implies that input output pricing policy in Pakistan favours IRRI growers more than the basmati growers which may increase its production in future.

13.3 Domestic Resource Cost Coefficient (DRC)

- Basmati paddy

74. Domestic Resource Cost Coefficient (DRC) is a measure of opportunity cost of domestic resources used per unit of the value added in production of a crop. DRC value less than one indicates a country's comparative advantage in a particular commodity and the vice versa. In this calculation numerator is the total non-traded inputs expenditure at social

prices and denominator is difference of the crop revenue and the traded inputs cost at social prices. As a principle, if DRC coefficient is greater than one, country does not have comparative advantage in the concerned crop and if it is less than one, it has comparative advantage in that crop. In other words, the crop is efficiently produced in that particular country and cost of resources employed in its production is less than its import cost.

75. DRC values for Basmati and IRRI are also produced in **Table-16**. It is observed from the data in this Table that DRC coefficient for basmati paddy in Punjab and IRRI in Sindh (2016-17 exception for Sindh) has been always less than one during the analysis period which indicates Pakistan's comparative advantage for Basmati in Punjab and for IRRI in Sindh.

13.4 Cost of Earning Foreign Exchange

76. It is already mentioned that DRC coefficient is a measure of the opportunity cost of the domestic resources (family labour, interest on capital, management charges, canal water charges, etc.) used in production of a crop. Thus DRC coefficient may be used to determine cost of foreign exchange earning in terms of domestic resources. The foreign exchange earning cost estimates are derived from the analysis produced in Table-16.

⁷⁷ It is observed from column 5 in the referred table that we spend less to earn forex through Basmati than IRRI because cost of domestic resources to earn one dollar are consistently less in Basmati than IRRI. Furthermore, these costs are relatively more stable and consistent in Basmati than IRRI paddy.

14. RICE YIELD AMONG COMPETING COUNTRIES

78. Global rice during 2019 occupied an area of 150.21 million hectares with a total production of 479.56 million tonnes. The world top 17 producing countries contribute 85.17 per cent of total area and 93.33 per cent of total production (Annex-XIV).

79. In terms of rice area, India is on the top with 43.780 million hectares followed by China, mainland with 29.69 million, Bangladesh with 11.18 and Indonesia, Thailand with 10.68,10.41 million hectares. Pakistan lies at 10th number in this regard.

80. In terms of rice production, China is on the top with 139.74 million tonnes followed by India with 118.43 million, Indonesia 36.40 and Bangladesh, Vietnam, Thailand with 36.39,29.36,21.46 million tonnes respectively. However, Pakistan lies at 9th position in rice production of the world.

81. In terms of yield per hectare, Australia lies at the top with 5847 kgs per hectare followed by Tajikistan with 5725, USA with 5582 and Egypt with 5582 kgs per hectare. It is very wonderful situation that Pakistan ranks at 61st in terms of yield while India falls at 55th position.(Annex-) It implies that there is a lot of potential to raise rice productivity per hectare in Pakistan.

15. MAJOR RICE VARIETIES AND THEIR YIELD POTENTIAL IN PAKISTAN

82. In Pakistan, rice is an important food and cash crop. It is the 2nd most important source of cash for the paddy growers. It also earns billion of rupees through its export. The yield potential of rice of different varieties sown in Punjab and Sindh are presented in Table-18.

83. Pakistan is a major rice exporting country in the World. However, the national yield at the farm level is low despite that tremendous potential exists there. According to the Provincial Agriculture Departments, based on last three years (2018-19 to 2020-21) average yield of rice paddy of different varieties of Punjab and Sindh, is 823 kgs per acre for Basmati, 1050 kgs for IRRI and 956 kgs for "others; in the Punjab. In Sindh, average yield level of IRRI paddy is 1109 kgs per acre and 1572 kgs for other varieties. These yields are much below than the available potential. To meet the ever growing domestic food and export requirements for foreign exchanges, there is a need to make solid efforts to achieve the available yield potential. Yield potential of important rice varieties is presented in Table-18.

16. IMPROVED SEED AVAILABILITY OF RICE PADDY

84. Seed is deemed as a nucleus of plant and plays a vital role in increasing the yield, thus it is necessary to use quality seed of the recommended varieties. In a self-pollinated crop like rice, experts recommend that at least 20% area of rice should be brought under fresh certified seed every year.

85. In order to review the overtime progress regarding coverage of quality seed, the annual gross and replacement of certified seed of rice and its availability during the period from 2015-16 to 2020-21 is presented in Annex-XVI.

86. It may be seen in Annex-XVI that supply of certified seed shows an irregular trend. Availability of certified seed at the country level during the referred period augmented and remained approximately 71.120 thousand tonnes in 2020-21 higher by 60.81% than the available certified seed (44.226 thousand tonnes) during 2019-20.

87. Varietal breakup of the supply of certified seed of rice both in public and private sectors for the crop year 2020-21 is presented in the Table-19.

Province/variety	Se	ed availabi	lity	Area sown	Seed requirement	Seed enough for area
1 Tovince/variety	Public sector	Pvt. Sector	Total			%
		(Tonne)		000 hac.	(Tonne)	
Punjab	5727.1	58398.0	64125.1	2394.4	35530.2	180.5
Basmati (Fine)	2042.2	22092.0	24134.2	1871.6	22459.2	107.5

Table-19:Variety wise Certified Seed of Paddy Supplied by Public and Private
Sectors for 2020-21 Crop

Source: FSC&RD, Islamabad

88. Provincial variety-wise data presented in the above table show that in all provinces major source of supply of certified seed was private sector. Share of the private sector in total seed availability is: Punjab (91%), Sindh (97%), Khyber Pakhtunkhowa (98%), Balochistan 100% and at country level 92%. Thus, it is concluded that certified seed of paddy was available to meet 120.4% of the total requirement in the country. The supply of certified seed does not need to be increased to ensure paddy growers' access to certified seed.

17. ACKNOWLEDGEMENTS

89. In preparing this Report, following officers and officials have put a lot of effort and hard work which is appreciated.

Officers

1.	Mr. Hussain Ali Turi	Chief
2.	Mr. Muhammad Amin	Chief
3.	Syed Riaz Ali Shah	Assistant Chief (Coordinator)
4.	Mr. Salman Mahmood	Assistant Chief
5.	Mrs. Shagufta Tasleem	Assistant Chief

Other Staff

1.	Mr. Hafeez Ahmed	Assistant Private Secretary
		(Composed the Report)
2.	Mr. Muhammad Shamir	Assistant Private Secretary
3.	Mr. Muhammad Naeem	DMO

Abdul Karim Director General

2:- Ine varieties of basmati grown in the KPK are of different characteristics than those in the Punjab, therefore, area and production of basmati varieties of this province have not been included with data of basmati of Punjab. Instead data of all varieties of rice in the KPK have been included under "Others" in the province as well as on overall basis. Rice grown in Balochistan has been considered as of IRRI variety as variety-wise breakup is not available.

ANNEX-IV Average farmer's cost of production of Basmati paddy in Punjab: 2020-21 and 2021-22 crops

Notes:

1. Cost of one tube well irrigation is derived by multiplying Rs 360/hour by 2.5 hours (time per irrigation).

 Cost of FYM is 25% of actual expenditure incurred on purchase of manure, loading/ unloading and transport expenditure.
 Underlying assumption is that effect of FYM lasts for two years i.e 50% of it will be consumed by rice crop and rest of the 50% will be consumed by the following crops. Again 50% consumption by paddy is reduced to one half because paddy is a six month crop.

3. Calculation may have minor differences due to decimal fractions.

Average farmer's cost of production of Irri paddy in Punjab: 2020-21 and 2021-22 crops

Notes:

1. Cost of one tube well irrigation is derived by multiplying Rs 360/hour by 2.5 hours (time per irrigation).

2. Cost of FYM is 25% of actual expenditure incurred on purchase of manure, loading/unloading and transport expenditure.

Underlying assumption is that effect of FYM lasts for two years i.e 50% of it will be consumed by rice crop and rest of the 50% will be consumed by the following crops. Again 50% consumption by paddy is reduced to one half because paddy is a six month crop.

3. Calculation may have minor differences due to decimal fractions.

Notes for Annex -VII:

- 1. The economic analysis presented in the above exercise is based on the input-output prices applicable for 2020-21 crops.
- 2. The data regarding input-output parameters have been adopted from the API's price policy papers for sugarcane, seed cotton, rice paddy and wheat, 2020-21 crops. However, the relevant data for sunflower and canola were adopted from the last support price policy for non-traditional oilseeds 2000-01 crops, with necessary adjustments in input prices for updating costs and incomes for the 2020-21 crops. To incorporate the escalations in input prices, which occurred during the growing period of 2020-21 crops, some marginal revisions/updates have been incorporated.
- 3. Water use has been estimated from the number of irrigations as reported in the cost of production estimates of the respective crops assuming each irrigation of 3 inches and 'rauni' of 4 inches.
- 4. The following prices as realized by the growers for different crops are adopted for the analysis:
 - 4.1 The support price of Rs 1800 per 40 kgs, as maintained by the Punjab and Rs 2000 by Sindh for 2020-21 crop, have been adopted for the current analysis.
 - 4.2 The wholesale market prices of basmati paddy and IRRI paddy during the postharvest period in major producer area markets have averaged at Rs 2000 and Rs 1300 per 40 kgs, respectively. While, the average price of IRRI paddy in Sindh is reported at Rs 1500 per 40 kgs.
 - 4.3 The wholesale market prices of seed cotton during the post-harvest months of 2020-21 in the main producer area markets have averaged at Rs 4524 per 40 kgs in the Punjab and Rs 4241 Sindh.
 - 4.4 The price of Sunflower crops has been reported hovering around Rs 4000/40 kgs and Rs 4000/40 kgs for Canola during 2020-21.
 - 4.5 The average market prices of sugarcane as realized by the farmers are taken for the analysis i.e Rs 250 per 40 kgs in the Punjab and Sindh. However, the prices notified by the provincial governments were lower i.e Rs 200 and 202, respectively for Punjab and Sindh.
- 5. The market prices have been adjusted for the marketing expenses to make them effective at the farm level. These expenses amount to Rs 18.5 per 40 kgs in Punjab and Sindh for sugarcane, Rs 40 for seed cotton in Punjab and Sindh, Rs 50 for rice paddy in Punjab and Sindh, and for wheat and oilseeds, Rs 40 in Punjab and Rs 45 in Sindh.

6.	Gross income	=	(Yield per acre <u>multiplied by</u> price of principal produce at farm gate) <u>plus</u> (value of by-products per acre).
7.	Cost of purchased inputs	=	Cost incurred on seed and related items, fertilizer, supplementary irrigation including labour, canal water rate, pesticides and weedicides.
8.	Gross margin	=	Gross income minus cost of purchased inputs
9.	Net income	=	Gross income minus gross cost.
10.	Output-input ratio	=	Gross income divided by gross cost
11.	Revenue per rupee of purchased inputs cost	=	Gross income <u>divided by</u> cost of purchased inputs
12.	Revenue per crop day	=	Gross income divided by crop duration in days
13.	Revenue per acre-inch	=	Gross income divided by irrigation water
	of water used		used in acre inches.

Notes:

The area under rice for the Punjab province represents area under basmati, IRRI and Others varieties while that of Sindh represents the area under IRRI and 'Other varieties'. For KPK and Balochistan total area under rice represents 'Othrs' and IRRI varieties, respectively.

The seed requirement has been worked by using the seed rate of 12 kgs per hectare for basmati and 25 kgs per hectare for IRRI and 'others' varieties.
